

OneSolar

An AI-native solar PV design platform — from conversation to bankable engineering

Why This Tool Is Needed

Solar design today is split across two disconnected worlds. Tools like Aurora Solar, OpenSolar, and similar platforms are excellent at fast, preliminary layouts — roof shape, panel count, rough sizing — but they stop there. Turning that preliminary layout into a construction-ready, bankable design still requires separate CAD software, manual electrical calculations, structural checks, and a qualified engineer working for days, sometimes weeks.

This gap creates real cost and delay for installers and EPC firms: slower proposals, higher engineering overhead, and inconsistent quality between projects. There is currently no widely available tool that takes a project from a plain description all the way to a complete, code-compliant engineering package — in one continuous, conversational workflow.

What OneSolar Is

OneSolar is an AI-native solar design platform. An engineer simply describes what they need — in English or any other language — and the system carries the project from concept through detailed, bankable engineering: panel layout, shading and yield simulation, electrical design, structural checks, code compliance, and final CAD/BOM/proposal output. Unlike existing tools, OneSolar does not stop at preliminary design — it is built to deliver the full, detailed package a real installation requires.

How It Works

The engineer talks to OneSolar the way they would brief a colleague. Underneath, the AI never performs the engineering itself — it only interprets intent and calls a set of deterministic, tested engineering services that do the actual calculations. This keeps every output accurate, auditable, and consistent, while the conversation stays natural and fast.

Impact

- Cuts detailed design turnaround from days or weeks to hours, without cutting engineering rigor.
- Replaces a fragmented, multi-tool workflow with one continuous, conversational process.
- Lowers the engineering overhead per project, letting installers quote and win more jobs faster.
- Removes the language barrier for global teams — the same engineering depth, in any language.

Why Now

Solar deployment continues to accelerate globally, while engineering talent to produce detailed, code-compliant designs has not scaled at the same pace. OneSolar is built to close that gap directly — giving installers and EPC firms of any size access to detailed engineering output that previously required a specialist team, at a fraction of the time and cost.

We would welcome the opportunity to walk through OneSolar in more detail and discuss how it could fit into your workflow.
